Description PI	Interpersonal attitude: pleasant, effective, and efficient communication/collaboration (formal and informal), constructive, respectful, empathetic, committed, reliable
Assessment:	Assessment of the rubric aspects takes place throughout the block (lab sessions) and trough performance deliverables (supported by evidence collected in the portfolio).

Aspect	Insufficient perfomance	Sufficient performance	Excellent performance
1. Self-reflection and personal development Students are expected to actively reflect on their experiences, behaviour, learning process and received feedback throughout the block and project in order to develop their professional attitude. They make use of the reflection methods provided.	The student shows no or limited willingness or ability to critically reflect on their interpersonal attitude and professional behaviour. Reflections are descriptive, lack structure (e.g. do not follow a reflection method), and show limited awareness of how their behaviour affects collaboration, communication, or professional relationships. There is little evidence that feedback is meaningfully considered or translated into improvement.	The student critically reflects on their interpersonal attitude and professional behaviour using an appropriate reflection method. Reflections demonstrate awareness of how their behaviour influences communication and collaboration, and incorporate feedback from others to identify strengths, areas for improvement, and appropriate actions for further development.	The student consistently demonstrates critical and purposeful reflection on their interpersonal attitude and professional behaviour. By integrating multiple sources of feedback and reflecting on the impact of their behaviour on communication, collaboration, and professional relationships, the student makes well-founded adjustments that demonstrably improve their effectiveness in professional interactions and contribute to their ongoing professional development.
2. Responsibility, proactiveness and ownership in relation to project collaboration Students are expected to take shared responsibility for the effectiveness of project collaboration by reliably fulfilling their own commitments and actively contributing to the coordination and continuity of team processes throughout the project (week 1–9). This includes proactive communication about progress and constraints, timely identification and resolution of issues affecting collaboration, supporting alignment within the team regarding tasks, planning, and delivery (timely submission of deliverables). They take initiative in adressing issues or unclarities and inform team members and the tutor in advance when unable to participate in a scheduled session.	The student contributes inconsistently to project collaboration and frequently fails to meet agreed responsibilities or deadlines. Communication about availability, progress, or problems is absent, unclear, or too late. The student shows limited awareness of how their behaviour affects team coordination and does not take initiative to address issues that impact collaboration or project progress. Deliverables are submitted late or incomplete.	The student reliably fulfils agreed responsibilities and contributes to maintaining project collaboration. They communicate progress, availability, and constraints in a timely manner and address issues professionaly when they arise. The student demonstrates awareness of their role within the team and contributes to keeping tasks and collaboration aligned, although this is mainly reactive rather than anticipatory. Team members and tutors are mostly informed in advance by the student when they are unable to participate in a scheduled session or when agreements or deadlines cannot be met. Most deliverables are submitted on time and complete.	The student demonstrates ownership of the entire project, takes active responsibility for the effectiveness of project collaboration and contributes to coordination within the team. They anticipate potential issues in planning or collaboration and take initiative to prevent or resolve them early. Communication is timely, structured, and supports alignment within the team. The student actively helps maintain continuity in shared work processes and contributes to improving overall team functioning, not only their own tasks. They attend most meetings and take responsibility for catching up independently to maintain continuity in their contribution. Deliverables are submitted on time and complete.
3. Professional behavior and communication Students are expected to demonstrate a professional and respectful attitude towards peers, tutors, stakeholders and others involved in the project context. This includes preparing and being on time for lab sessions and project work, sharing progress, enganging in guest lectures or other professional activities, and applies to all forms of communication throughout the project (verbal, non-verbal and written communication). They communicate clearly and constructively, listen actively, respond appropriately to feedback and differing perspectives, and address misunderstandings in a professional manner. They use a basic understanding of cultural backgrounds to interpret behaviours and adapt communication in diverse teams. They show openness to improving their cultural awareness.	The student is often late and/or does not share regularly or in a professional manner progress, updates, or other relevant information with the team, which negatively affects coordination and teamwork. The student demonstrates limited interpersonal awareness, has difficulty adapting communication to different people or contexts, requires frequent guidance in professional interactions and does not act on feedback. The student fails to comply with the collaboration contract.	The student communicates and behaves professionally across project and professional contexts, with different people. They respond to messages, requests, and feedback in a timely manner and share relevant updates and progress with the team to support coordination and teamwork. They establish constructive working relationships, adapt their communication to different audiences and situations, and contribute positively to collaboration. The student demonstrates interpersonal awareness, adresses misunderstandings when they arise, act on feedback and represents themselves and the programme professionally with limited guidance. The student is mostly prepared and on time for activities. The student complies within the limits of the collaboration contract.	The student communicates clearly, respectfully, and consistently in all types of communication and interactions and is able to adapt their communication style to improve mutual understanding. They are are able to navigate challenging interactions constructively, clarify potential issues early, and build effective professional relationships across diverse contexts. The student supports an inclusive team environment, and serves as a positive professional representative of the team and programme. They are prepared and on time for activities. They proactively show opennes to grow in their intercultural awareness. The student fully complies with the collaboration contract.
4. Dealing with complexity and change Students are expected to navigate uncertainty, changing requirements, and complex project situations in a deliberate and solution-oriented manner. They analyse challenges from different perspectives (both technical and professional), make well-reasoned decisions, and adapt their approach while maintaining progress. They contribute to helping the team deal effectively with complexity, ambiguity, and change.	The student struggles to deal with uncertainty or changing circumstances and has difficulty determining an appropriate course of action. They rely heavily on guidance, show limited initiative in analysing problems, and rarely adapt their approach when circumstances change. Their response to complexity negatively affects project progress or collaboration.	The student analyses project challenges and changing circumstances before selecting an appropriate course of action. They adapt their approach when needed, seek clarification where appropriate, and continue contributing effectively despite uncertainty.	The student approaches uncertainty confidently and systematically. They analyse complex situations from different perspectives, make well-reasoned decisions despite incomplete information, and adapt strategies as new information becomes available. They actively help the team navigate complexity, encourage solution-oriented thinking, and contribute to informed decision-making during changing project conditions.
5. Professional skills The student purposefully integrates and applies professional and academic skills required to function effectively in project-based and professional contexts. This includes: • maintaining a professional portfolio that documents evidence of learning and professional development; • giving and approriatly reacting to constructive (peer)feedback; • preparing and carrying out professional activities like organizing collaborative processes (e.g. meetings, coordination of shared work, etc.) • planning, monitoring, and adapting work in iterative cycles based on feedback and changing priorities (projectmanagement), using a project management tool for alignment and visualisation of progress within the team; • taking on and switching between functional roles within a team context; • preparing, conducting, and analysing user research activities (e.g. interviews and focus groups) to generate relevant insights for the project; • critically working with information and evidence (research) to support conclusions and decisions within the project context; • presenting and substantiating ideas and outcomes for different audiences and purposes; • responsible use of AI as a supportive tool while maintaining responsibility for critical thinking, decision-making, and the final output;	The student demonstrates limited integration and application of professional and academic skills. They require substantial guidance to organise their work, contribute effectively to professional activities, and apply feedback, information, or tools appropriately. There is limited evidence of using skills purposefully to support project progress, justify decisions, or communicate outcomes effectively.	The student applies professional and academic skills effectively within project and professional contexts. They align their work with the team, contribute to collaborative processes, use feedback and evidence to improve outcomes, and select appropriate approaches and tools to support project progress. The student communicates and substantiates ideas appropriately for different audiences and demonstrates responsible use of digital and AI tools.	The student purposefully integrates professional and academic skills to improve both their own performance and project outcomes. They adapt their approach to different situations, and use feedback, evidence, and tools strategically to coordinate activities and make well-founded decisions. The student communicates confidently with different audiences, demonstrates professional judgement in the use of AI and digital tools, and continuously develops their professional practice based on reflection and experience.
Evaluation	PI8 will be assessed as "pass" or "fail". To receive a "pass", the assessment of **all rubric aspects** needs to be (at least) "sufficient" When assessed "fail" (e.g. one or more aspects are assessed as insuficient) the maximum course grade is 5.0 (Even if the student receives a passing grade for other PI's, of the course). A 5.0 means the student does not pass the course and needs to take the resit. Description of the resit can be found in Moodle.
